Title : The Effectiveness of Liquid Ammonia Fertilizers  
during the Vegetation Period in Cotton.

Orig Pub : Sots. s. kh. Uzbekistana, 1957, No 6, 17-18

Abstract : On the basis of a field experiment conducted  
at the sovkhoz imeni Fifth Anniversary in the  
UzSSR, it was determined that liquid ammonia  
is completely absorbed by the soil at the place  
of application. This fact makes it possible to  
apply it in the early period of the plant's  
development at a distance of 15-22 centime-  
ters from the row. Liquid ammonia had no ne-

TITLE: Investigation of internal bremsstrahlung accompanying beta decay of phosphorus-  
32 with a three-crystal scintillation spectrometer (Transactions of the Fifteenth  
Annual Conference on Nuclear Spectroscopy and Nuclear Structure held at Minsk  
23 January to 2 February 1965) 19.44.55

SOURCE: AN SSSR, Izvestiya. Seriya fizicheskaya. v. 29, no. 12, 1965, 2247-2249

TOPIC TAGS: bremsstrahlung, beta decay, phosphorus, scintillation spectrometer,  
Compton effect, spectral energy distribution,

ABSTRACT: The authors have continued the investigation of the internal bremsstrahlung from p32, the initial stages of which were reported in the preceding paper by K.A. Korotkov and A.P. Shumeyko (Izv. AN SSSR Ser. Fiz., 29, 2243 (1965); see Abstract AP6002680/). In the present work with the two-crystal scintillation Compton spectrometer described in the preceding paper was employed to detect and measure the energy of the internal bremsstrahlung; the spectrometer was provided with a third channel, however, and only triple coincidences between the Compton electron, the Compton scattered photon, the beta particle were recorded. The beta channel employed a 7 mm thick tolan scintillator which was so mounted as to record beta particles emitted at

Card 1/3

L 13836-66

ACC NR: AP6002681

right angles to the direction of the internal bremsstrahlung photon. The triple coincidence technique has the following advantages over the double coincidence technique employed in the earlier work; differential spectra can be recorded; it is not necessary to know the absolute intensity of the source; no correction for external bremsstrahlung is required; larger solid angles can be used; and the background due to the continuous Compton distribution accompanying the total gamma-ray absorption line is completely avoided. The counting rate is low, however. The spectrometer was calibrated twice daily with gamma rays from the aid of Co<sup>60</sup> and Zr<sup>95</sup> + Nb<sup>95</sup> sources, and it remained stable within 1% during the measurements. The P<sup>32</sup> source was prepared by evaporating a Na<sub>2</sub>HPO<sub>4</sub> solution in a 2.5 mm diameter 3 mm high Plexiglas cylinder with 0.5 mm wall thickness and was mounted on between the two scintillators of the Compton spectrometer at a distance of 2 cm from one scintillator and 6.5 cm from the other. The tolane crystal for detecting beta particles was located 4 cm from the source. The intensity of the source was  $1.17 \times 10^6$  decays/sec; it was shielded on two sides with 1.025 g/cm<sup>2</sup> disks of beryllium to avoid accidental coincidences due to beta particles. The accidental coincidence rates were determined by introducing delay lines into different inputs to the coincidence circuit and correction was made for them. The internal bremsstrahlung spectrum was recorded over the photon energy range from 300 to 1600 keV. At photon energies below 900 keV, the measurements are in good agreement with the theory of J.K. Knipp and G.E. Uhlenbeck (Physica, 3, 425, (1936)) as corrected for the Coulomb effect by R.R. Lewis and G.W. Ford (Phys. Rev., 107, 756 (1957)) and S.B. Nilsson (Arkiv fys., 10, 467 (1956)). At higher energies the measured internal bremsstrahlung intensity is considerably greater than the theoretical.

Treatment of contractures with novocaine block.

American Review of Soviet Medicine, New York 1947, 4/3 (198-200)

Astvatsaturov distinguishes mechanical, trophic and reflex- (of sympathetic or psychoneurotic origin) contractures as well as antagonistic and analgesic varieties. They occur after injuries to nerves, muscles, etc. and after surgical manipulations (including setting and plaster cast). They are demonstrated when methods producing Marie-Foix, Leri and Mayer defensive reflexes are applied. Repeated novocaine block of the affected joint improves the condition; the effects appears after 12-15 days

4947. KRISHOVA N. A. and MASHKOVSKIY M. D. • Pharmacological properties and therapeutic use of a new drug, pachykarpin. (Russian text) SOVZETSK.MED. 1953, 2 (36-38)

The ganglion depressant action of pachykarpin, a new alkaloid, isolated from *Sesuvia* and *Thermopsis lanceolata* is described. It has low toxicity, 10 mg./kg. in rabbits and dogs being well-tolerated. These doses cause a slowing of the pulse rate, lengthening of the P-Q interval in the ECG and slowing of impulse conduction. The drug depresses conduction through vegetative ganglia without previous excitation. Sympathetic ganglia especially are affected. A striking stimulant effect on uterus in situ and isolated was observed. Experiments with conditioned reflexes show that the alkaloid increases protective inhibition processes in the brain. The effects of extensive clinical trials are reported. The drug was found useful for various endarteritic states, especially spastic forms. Myopathic cases also improved. In obstetrics the drug stimulates labour. It does not affect the blood pressure, which makes it more useful than posterior pituitary extract. It may also be given to patients with nephro-toxic changes, but should not be used during pregnancy. Rašková - Prague

- (1) The non-conditioned and the conditioned reflexes in the first signal system were fundamentally present in the examined patients and met the required conditions.  
(2) The weakness of the conditioned reflexes, which was mainly connected with the 1st signal system, is not specific for aphasia. (3) Even in patients with gross speech deficiency, the 2nd signal system is not destroyed. The functional systems which have formed owing to the organizing function of the word, have been preserved. The same applies to the experience gathered in life on account of the co-operation of the signal systems. (4) In all the 14 patients, the disturbances of the higher nervous activity mainly affected the speech-kinaesthetic analyser; in 2 also the speech-acoustic and in 1 the speech-optic analyser. (5) For the examination of the functional conditions of the damaged speech analysers, special clinical and physiological methods and a special technique are necessary. One of these may be dermolexy, which is used for the study of the speech-kinaesthetic synthesis anal.

3647

ser. With this method, in motor aphasia, the speech-kinaesthetic synthesis analyser discloses marked difficulty in the formation of new associations, a very marked inertia of the provocation of response and a weakness, that becomes apparent when constructing sentences. Consequently, dermolexy is a method which reflects objectively the specific aspect of the disturbance of the higher nervous activity in motor aphasia.

corresponded to restoration of the tendon reflex as  
a result of therapy. In the investigation in 45 pa-  
tients of conditioned motor reactions with verbal  
support there was observed a weakening of the basic  
cortical processes (slow formation, instability of  
positive and inhibitory conditions of the reaction,  
disturbance of mobility and strength of the condition).  
Treatment with bismuth carbonate, pachycarpine, or  
glutamic acid enhanced the cortical neurodynamics and  
trophicity of the muscles. -- K.S. Ratner

KRYSHTAB, G. S.

"Development of a Compressed-Gas, Electrostatic Accelerator and Investigation of Those Properties Determining Its Basic Parameters," by G. S. Kryshtab, Institute of Physics, Academy of Sciences Ukrainian SSR, Ukrainskiy Fizicheskiy Zhurnal, Vol 1, No 4, Oct/Dec 56, pp 313-322

"A compressed-gas, 2.5-Mev electrostatic accelerator was designed, built and put in operation in 1953 at the Institute of Physics, Academy of Sciences Ukrainian SSR. The accelerator is used as a neutron source.

"The ion source is of latest design in its application of electron oscillations in a magnetic field. The source delivers gas at the rate of 3.5 cm<sup>3</sup>/hr at 200 microamperes.

"The device for investigating the operating conditions of the ion source ensures complete reproduction of operating conditions of the source in the accelerator because its essential elements were designed from focusing calculations based on a method proposed by Elkind for three-element systems (Rev Sci Instr, 24, 21 and 29, 1953).

"The accelerating tube is of latest design and has a length of 24 meters and an accelerating voltage of 2,500 kv. The electrodes are cone-shaped and generate a uniform field along the axis...."

"Bremsstrahlung which arises in the accelerating tube has considerable intensity, increases sharply with an increase in accelerating voltage, and corresponds to stopping of electrons with energies less than 2.5 times the energy of the accelerated electrons." (U)

SOV/4012

Akademiya nauk Ukrainskoy SSR. Otdeleniye fiziko-matematicheskikh nauk.  
Sessiya po mirnomu ispol'zovaniyu atomnoy energii

Trudy (Transactions of the Session on Peaceful Uses of Atomic Energy), Kiyev,  
Izd-vo AN Ukrainskoy SSR, 1958. 188 p. 2,500 copies printed.

Resp. Ed.: M. V. Pasechnik, Doctor of Physics and Mathematics; Editorial Board:  
A. K. Val'ter, Academician, Academy of Sciences Ukrainskaya SSR, O.F. Nemets,  
Candidate of Physics and Mathematics, M. V. Pasechnik, Doctor of Physics and  
Mathematics; Ed. of Publishing House: T. K. Remennik; Tech. Ed.:  
N. P. Rakhlina.

PURPOSE: This collection of articles is intended for physicists and scientific  
personnel working in nuclear research.

COVERAGE: The articles in this collection discuss linear proton accelerators,  
electron accelerators, electrostatic accelerators, magnetron lenses, the  
interaction of charged particles and neutrons with nuclei, the applications  
of tagged atoms in physics research, and experimental methods. Some of the  
articles are descriptions of already existing nuclear installations and ex-  
perimental apparatus. No personalities are mentioned. There is a bibliog-  
raphy of Soviet and non-Soviet sources at the end or most of the articles.

Translation from: Referativnyy zhurnal. Fizika, 1959, Nr 12, p 55 (USSR)

AUTHORS: Batalin, V.A., Kopytin, N.S., Kryshkin, G.S., Pasechkin, M.V.  
Strizhak, V.I.TITLE: On the Transverse Cross-Sections of Non-elastic Scattering of  
Fast Neutrons <sup>79</sup>PERIODICAL: Tr. Sessii AS UkrSSR po mirn. ispol'zovaniyu atomm. energii.  
Kiyev, AS UkrSSR, 1958, pp 102 - 106ABSTRACT: The cross-section of a non-elastic scattering of 2.5, 3.3 and  
4.1 Mev neutrons from medium and heavy nuclei (from Na to Bi)  
was measured by the transmission through thin spherical layers  
method. The D (d,n) He<sup>3</sup> reaction served as the neutron source,  
a low-voltage accelerator and an electrostatic generator were  
used to accelerate the deuterons. P<sup>31</sup>, Ar<sup>27</sup> and S<sup>32</sup> were used  
as neutron detectors, since the threshold of (n,p) reactions  
with them is near the energy of the source neutrons. It is  
established that the cross-sections of non-elastic scattering of  
neutrons increase smoothly for all nuclei, except "magic" ones,

Card 1/2

SOV/58-59-12-26888

On the Transverse Cross-Sections of Non-Elastic Scattering of Fast Neutrons

at 2.5 to 4.1 Mev, with an increase in the atomic number. In the case of "magic" nuclei, the non-elastic scattering cross-section is considerably less than those of the nearby nuclei. Considerable anomalies are observed in the cross-sections of non-elastic scattering in heavy nuclei, which decrease with an increase in the neutron energy.

I.P. Sadikov
